

NEW! - Innovative solar water heater

The best ideas tend to be simple and the bubblesun panel combines this ingeniously with high performance quality materials to make a very effective solar water heater. Ideally suited for flat roof installations as it performs efficiently without the need for it to be mounted at a specific inclination or position.

This makes it perfect for a temporary accommodation or mobile welfare applications.

Depending on your water quantity requirements, the panels can be linked together to increase the available water quantity and temperature. From a single panel providing handwash water to multiple panels servicing showers and/or washdown facilities.

To supplement heating in the cooler seasons, the panels can be incorporated into an electric or independent diesel heater installation to provide a complete all year round solution.

In cabins where generators are fitted, they offer an effective way of reducing the generator run hours, generator maintenance, noise nuisance, fuel usage, carbon emissions and associated costs.

Bubblesun - Reducing emissions, reducing costs

- .Annually more efficient than a conventional flat panel
- No inclination / No orientation needed
- Lightweight - only 8 kg - easy install by one person
- All plastic construction - no corrosion, no scale build up
- Up to 50 litres of 45°C hot water per day
- Reduced emissions and operating costs
